

Input

```
import math

n = int(input("Enter n: "))
known = int(input("Enter known value: "))

factor = math.gcd(n, known)

if factor == 1 or factor == n:
    print("No useful factor found")
else:
    p = factor
    q = n // factor
    print("p =", p)
    print("q =", q)
```

Output

```
Enter n: 3599
Enter known value: 122
p = 61
q = 59
```
